Developing Microservices with OCP (Openshift Container Platform)

Openshift is an Enterprise version of Kubernetes and Containers are commonly seen as "the new Application Servers": in this talk we'll look at how twelve factor moves @ the infrastructure level with the help of OCP. We'll look at Java, Vertx, Spring Boot & Golang code and how we can manage the whole thing from a single pane of glass.

Ugo Landini

Ugo Landini takes the sentence "The only difference between men and boys is the cost of their toys" very seriously. He works daily as a Principal Software Architect @ Red Hat. He dedicates the rest of his time to what's new in the IT field and is strongly convinced that sharing knowledge is not only a must but also an opportunity of personal growth: co-founder of the JUG Roma, Ugo is an Apache committer, develops games for mobile devices and is convinced he can still play a decent football. He is also Co-Founder and Chair of Technical Committee at Codemotion.
